

Mass-Storage Structure

Exercises

- **11.12** None of the disk-scheduling disciplines, except FCFS, is truly fair (starvation may occur).
 - a. Explain why this assertion is true.
 - b. Describe a way to modify algorithms such as SCAN to ensure fairness.
 - c. Explain why fairness is an important goal in a multi-user systems.
 - d. Give three or more examples of circumstances in which it is important that the operating system be unfair in serving I/O requests.
- 11.13 Explain why NVM devices often use an FCFS disk-scheduling algorithm.
- **11.14** Suppose that a disk drive has 5,000 cylinders, numbered 0 to 4,999. The drive is currently serving a request at cylinder 2,150, and the previous request was at cylinder 1,805. The queue of pending requests, in FIFO order, is:

2,069; 1,212; 2,296; 2,800; 544; 1,618; 356; 1,523; 4,965; 3,681

Starting from the current head position, what is the total distance (in cylinders) that the disk arm moves to satisfy all the pending requests for each of the following disk-scheduling algorithms?

- a. FCFS
- b. SCAN
- c. C-SCAN
- **11.15** Elementary physics states that when an object is subjected to a constant acceleration *a*, the relationship between distance *d* and time *t* is given by $d = \frac{1}{2}at^2$. Suppose that, during a seek, the disk in Exercise 11.14 accelerates the disk arm at a constant rate for the first half of the seek,

88 Chapter 11 Mass-Storage Structure

then decelerates the disk arm at the same rate for the second half of the seek. Assume that the disk can perform a seek to an adjacent cylinder in 1 millisecond and a full-stroke seek over all 5,000 cylinders in 18 milliseconds.

- a. The distance of a seek is the number of cylinders over which the head moves. Explain why the seek time is proportional to the square root of the seek distance.
- b. Write an equation for the seek time as a function of the seek distance. This equation should be of the form $t = x + y\sqrt{L}$, where *t* is the time in milliseconds and *L* is the seek distance in cylinders.
- c. Calculate the total seek time for each of the schedules in Exercise 11.14. Determine which schedule is the fastest (has the smallest total seek time).
- d. The **percentage speedup** is the time saved divided by the original time. What is the percentage speedup of the fastest schedule over FCFS?
- **11.16** Suppose that the disk in Exercise 11.15 rotates at 7,200 RPM.
 - a. What is the average rotational latency of this disk drive?
 - b. What seek distance can be covered in the time that you found for part a?
- **11.17** Compare and contrast HDDs and NVM devices. What are the best applications for each type?
- **11.18** Describe some advantages and disadvantages of using NVM devices as a caching tier and as a disk-drive replacement compared with using only HDDs.
- **11.19** Compare the performance of C-SCAN and SCAN scheduling, assuming a uniform distribution of requests. Consider the average response time (the time between the arrival of a request and the completion of that request's service), the variation in response time, and the effective bandwidth. How does performance depend on the relative sizes of seek time and rotational latency?
- **11.20** Requests are not usually uniformly distributed. For example, we can expect a cylinder containing the file-system metadata to be accessed more frequently than a cylinder containing only files. Suppose you know that 50 percent of the requests are for a small, fixed number of cylinders.
 - a. Would any of the scheduling algorithms discussed in this chapter be particularly good for this case? Explain your answer.
 - b. Propose a disk-scheduling algorithm that gives even better performance by taking advantage of this "hot spot" on the disk.

- **11.21** Consider a RAID level 5 organization comprising five disks, with the parity for sets of four blocks on four disks stored on the fifth disk. How many blocks are accessed in order to perform the following?
 - a. A write of one block of data
 - b. A write of seven continuous blocks of data
- **11.22** Compare the throughput achieved by a RAID level 5 organization with that achieved by a RAID level 1 organization for the following:
 - a. Read operations on single blocks
 - b. Read operations on multiple contiguous blocks
- **11.23** Compare the performance of write operations achieved by a RAID level 5 organization with that achieved by a RAID level 1 organization.
- **11.24** Assume that you have a mixed configuration comprising disks organized as RAID level 1 and RAID level 5 disks. Assume that the system has flexibility in deciding which disk organization to use for storing a particular file. Which files should be stored in the RAID level 1 disks and which in the RAID level 5 disks in order to optimize performance?
- **11.25** The reliability of a storage device is typically described in terms of mean time between failures (MTBF). Although this quantity is called a "time," the MTBF actually is measured in drive-hours per failure.
 - a. If a system contains 1,000 disk drives, each of which has a 750,000hour MTBF, which of the following best describes how often a drive failure will occur in that disk farm: once per thousand years, once per century, once per decade, once per year, once per month, once per week, once per day, once per hour, once per minute, or once per second?
 - b. Mortality statistics indicate that, on the average, a U.S. resident has about 1 chance in 1,000 of dying between the ages of 20 and 21. Deduce the MTBF hours for 20-year-olds. Convert this figure from hours to years. What does this MTBF tell you about the expected lifetime of a 20-year-old?
 - c. The manufacturer guarantees a 1-million-hour MTBF for a certain model of disk drive. What can you conclude about the number of years for which one of these drives is under warranty?
- **11.26** Discuss the relative advantages and disadvantages of sector sparing and sector slipping.
- **11.27** Discuss the reasons why the operating system might require accurate information on how blocks are stored on a disk. How could the operating system improve file-system performance with this knowledge?
